DURATION: 90 minutes

 \diamond Answer all the questions. ⋄ Write the solutions explicitly and clearly. Use the physical terminology. ⋄ You are allowed to use Formulae Sheet. \diamond Calculator is allowed. ⋄ You are not allowed to use any other electronic equipment in the exam. \diamond I declare hereby that I fulfilled the requirements for the attendance according to the University regulations and I accept that my examination will not be valid otherwise.

This page is intentionally left blank. Use the space if needed.

1. A) A 2.5 kg block slides into a spring with a spring constant of $320 \ N/m$. When block stops, it has compressed the spring by 7.5 cm. The coefficient friction between the block and the horizontal surface is 0.25.

What is the block's speed just as the block reaches the spring?

Work-Energy Theorem $\triangle K+SU+SE_{th}=W=0$ (no enternal
 $\triangle K_{\overline{D}}K\rho - Ki$ { $K\rho=0$ sine $\triangle Fme$ & $m=2.5$ kg
 $\triangle U=-U_{S}=\frac{1}{2}k\pi^{2}$ { $k=320$ N/m $\Delta E_{th} = f_k x = (h_k mg)x \{M_k = 0.25$
 $\approx 2 - \frac{1}{2}mv_t^2 + \frac{1}{2}kx^2 + h_k mgx = 0$ $v_i = \frac{2}{m} \sqrt{\frac{1}{2} kx^2 + M_e m g x} = \frac{2}{2.5 k g} \sqrt{\frac{1}{2} 320 \frac{N}{m} (75 \times 10^{-2} m)^2}$
= 0.93 m/s

B) In Figure, a block of ice slides down a frictionless ramp at angle $\theta = 50^{\circ}$ while an ice worker pulls on the block (via a rope) with a force $\vec{F_r}$ that has a magnitude of 50 N and is directed up the ramp. As the block slides through distance $d = 0.50$ m along the ramp, its kinetic energy increases by 80 J. How much greater would its kinetic energy have been if the rope had not been attached to the block?

 $\Delta K + \Delta U + W = 0$
 $\begin{array}{ccc}\n&\text{S} & \text{S} & \text{S} \\
&\text{S} & \text{S} & \text{S} & \text{S} \\
&\text{S} & \text{S} & \text{S} & \text{S} \\
&\text{S} & \text{S} &$

C) A force $\vec{F} = (cx - 3x^2)\hat{x}$ acts on a particle as the particle moves along an x axis, with \vec{F} in newtons, x in meters, and c a constant. At $x = 0$, the particle's kinetic energy is 20.0 J; at $x = 3.00$ m, it is 11.0 J. Find c.

$$
w = \int \vec{F} \cdot d\vec{u} = \int \vec{F}_x \, dx = \int (c x - 3x^2) \, dx
$$

\n
$$
= \frac{c}{2} x^2 - x^3 \Big|_0^3 = 4.5 c - 27 \frac{3}{3}
$$

\n
$$
w = \Delta K = K_f - K_i = 11 - 20 = -95 \frac{3}{3}
$$

\n
$$
\Rightarrow 4.5c - 27 = -9 \implies c = 4 \frac{4}{3}
$$

2. Figure below shows an 8.00 kg stone at rest on a spring. The spring is compressed 10.0 cm by the stone.

i What is the spring constant?

ii The stone is pushed down an additional 30.0 cm and released. What is the elastic potential energy of the compressed spring just before that release?

iii What is the change in the gravitational potential energy of the stone-Earth system when the stone moves from the release point to its maximum

Martin Streetheight? 200202020

> iv What is that maximum height, measured from the release point?

 $m = 8 kg$
 $y = 0.1m$
 $d = rest$

DEPARTMENT:

⋄ Answer all the questions.

 \diamond Write the solutions explicitly and clearly.

Use the physical terminology.

 \Diamond I declare hereby that I fulfilled the requirements for the attendance according to the University regulations and I accept that my examination will not be valid otherwise.

This page is intentionally left blank. Use the space if needed.

1. (Kinetic Energy and Work) A 250 g block is dropped onto a relaxed vertical spring that has a spring constant of $k = 2.5$ N/cm. The block becomes attached to the spring and compresses the spring 12 cm before momentarily stopping.

What is the speed of the block just before it hits the spring (assume that friction is negligible)?

Answer: $v = 3.5$ m/s

2. (Kinetic Energy and Work) An object having a mass of 1 kg, which is initially at rest at point A, starts its motion along frictionless path of A-C and finally, stops momentarily after it compresses the spring $(k = 100 \text{ N/m})$ by x m. Take $g = 10 \text{ m/s}^2$.

- i Find the compression distance, x , if angle θ of the inclined plane is 30^o and the distance travelled on inclined plane, d, just before hitting the spring is 1.0 m.
- ii The object starts moving in opposite direction after it stops momentarily. What is the speed of the object just after it starts its motion in opposite direction?
- iii Determine the final position of the object at the end of motion in opposite direction along path $C - A$.

Answer: i)
$$
x = 0.5
$$
 m ii) $v = 5$ m/s iii) A

3. (Kinetic Energy and Work) Figure gives the acceleration of a 2.00 kg particle as an applied force F_a moves it from rest along an x –axis from $x = 0$ to $x = 9.0$ m. The scale of the figure's vertical axis is set by $a_s = 6.0 \, m/s^2.$

How much work has the force done on the particle when the particle reaches

$$
i\ x=4.0\ m,
$$

ii $x= 7.0$ m.

iii What is the particle's speed and direction of travel when it reaches $x=4.0$ m.

4. (Kinetic Energy and Work - 40%) A block of mass $m = 2.0$ kg is dropped from height $h = 40$ cm onto a spring of spring constant $k =$ 1960 N/m (See the figure below).

Find the maximum distance the spring is compressed.

System: Block+spring+ Zorth
\nNo extend forces =) Method real energy is conserved.
\n
$$
R_{i} + U_{i} = R_{i} + U_{f}
$$
\n
$$
R_{i} + U_{i} = R_{i} + U_{f}
$$
\n
$$
= \frac{1}{2}R_{i} + U_{f}
$$
\n
$$
= \frac{1}{2}L_{i} + U_{f}
$$
\n
$$
=
$$

5. (Kinetic Energy and Work- 40%) A 120 kg mass hangs by vertical rope $L = 3.5$ m long as in Figure a. A person then displaces the mass to a position $d = 2.0$ m sideways from its original position, always keeping the rope taut, and holds it in this new position as in Figure b.

As the mass is moved to this position, how much work is done by the person?

Answer: 738 J

- 6. (Kinetic Energy and Work- 40%) The spring of a spring gun has force constant $k = 400 \frac{N}{55}$ and negligible mass. The spring is compressed 6.00 cm , and a ball with mass 30.0 g is placed in the horizontal barrel against the compressed spring. The spring is then released, and the ball is propelled out the barrel of the gun. The barrel is 6.00 cm long, so the ball leaves the barrel at the same point that it loses contact with the spring. The gun is held so he barrel is horizontal.
	- i Calculate the speed of the ball as it leaves the barrel if a constant resisting force of 6.00 N acts on the ball as it moves along the barrel.
	- ii What is the greatest speed the ball have along the barrel if a constant resisting force of $6.00 N$ acts on the ball as it moves along the barrel?

Answer: i) 4.90 m/s ii)5.20 m/s

$$
k = 400 \text{ N/m}
$$
\n
\n1) $f \leftarrow 0$ f_{spring} , $f = 600 \text{ N}$
\n $m = 30g$ $\frac{x_0}{v} = 6 \text{ cm}$
\n $W_{\text{tot}} = k_f - k_i^2$
\n $W_f + W_{\text{Fpring}} = \frac{1}{L} m v^2$, $W_f = \frac{3}{L} x_0 = - f x_0$
\n $W_{\text{Fpring}} = \frac{1}{L} k x_0^2 - \frac{1}{L} k x_0^2$
\n $- f x_0 + \frac{1}{L} k x_0^2 = \frac{1}{L} m v^2$
\n $- (600 \text{ N})(0.06 \text{ cm}) + \frac{1}{L} (400 \text{ N/m}) (0.06 \text{ m})^2 = \frac{1}{L} (30 \text{ m/s}^2 \text{ kg}) v^2$
\n $\frac{19 = 4.90 \text{ m/s}}{19 = 4.90 \text{ m/s}}$
\n $f \leftarrow 0$ f_{Fpring} $\frac{1}{L} f = 0 \implies kx = f$
\n $W_f + W_{\text{Fpring}} = K_f - k_i^2$
\n $-f(x-x_0) + \frac{1}{L} k x_0^2 - \frac{1}{L} k x_0^2 = \frac{1}{L} m v_{\text{max}}^2$
\n $f \leftarrow 600 \text{ N} - 606 \text{ m} - 606 \text{ m} + \frac{1}{L} (400 \text{ N/m}) (\frac{6.00 \text{ N}}{400 \text{ N/m}})^2 = \frac{1}{L} (30 \text{ x} 10^{-3} \text{ kg}) v_{\text{max}}^2$
\n $\frac{1}{200 \text{ N/m}} = 5.20 \text{ m/s}$

7. (Potential Energy and Conservation of Energy) In the figure below, a block slides along a track from one level to a higher level after passing through an intermediate valley. The track is frictionless until the block reaches the higher level. There a frictional force stops the block in a distance d.

The block's initial speed v_0 is 6.0 m/s, the height difference h is 1.1 m, and μ_k is 0.60. Find d.

Answer: $d = 1.2$ m

Sustem: Black + Farth + track No external force, then $0 - \Delta E_{nech} + \Delta E_{fn}$ O = $(\frac{1}{a} m y_4^b + mgh) - \frac{1}{2} m y_i^2 + f_k d$

O = $mgh - \frac{1}{2} m y_i^2 + \mu_k (mgh) d$ ($\pi = mg h + \frac{1}{2} m y_i^2 + \mu_k (mgh) d$ ($\pi = mg h + \frac{1}{2} m y_i^2 + \mu_k (mgh) d$ ($\pi = mg h + \frac{1}{2} m y_i^2 + \mu_k (mgh) d$ ($\pi = g_k h$ as the external force; (12)
 $d = \frac{1}{M} \left(\frac{v_i^2}{2g} - h \right) = \frac{1}{0.60} \left[\frac{(6.0 - k_j)^2}{2(9.8 - k_j)} - (1.4 - k) \right]$
 $\Rightarrow \frac{1}{d = 1.2 \text{ m}}$

8. (Potential Energy and Conservation of Energy - 40%) Consider the track shown in Figure below. The section AB is one quadrant of a circle of radius 2.0 m and is frictionless. B to C is a horizontal span 3.0 m long with a coefficient of kinetic friction $\mu_k = 0.25$. The section CD under the spring is frictionless. A block of mass $1.0\ kg$ is released from rest at A. After sliding on the track, it compresses the spring by 0.20 m.

Determine the stiffness constant k for the spring.

Allint: Chonge in internal energy. Δ Uint = $-Wother$ Worker: The work alone by forces other than conservative forces (gravitational
Chawlen convervation of energy) elastic force, ...) $\Delta K + \Delta U + \Delta U \cdot n + = 0$ (low of conservation of energy) $K + 2u + 2u$ in $= 0$ (cow of constraint of energy)
 $(K_f - K_i) + (u_f - u_i) + (-W_{finc.}) = 0$, $u_f = \frac{1}{2} K x_{max}^2$ $U_{\tilde{r}} = mg \Gamma$
 $W_{F_{\tilde{r}rrc}} = \overrightarrow{F_{fric}} \stackrel{\rightarrow}{AX} = \mu_k mg 4X \cos 180^\circ$
 $W_{\tilde{r}rrc} = \mu_k mg 4X \cdot 180^\circ$ $\frac{1}{2}kx_{\text{max}}^2$ - mgr + μ k mg | Bc| = 0 $\frac{1}{2}$ K Amox - mgr + fue nig 1 DC
 $\frac{1}{2}$ K (0.20m)² - (1.0 kg)(9.80 m/s²)^{(2.0m}) + (0.25)(1.0 kg)(9.80 m/s²)(30m) \rightarrow $k = 612.5$ N/m

9. (Potential Energy and Conservation of Energy - 40%) A 2.00 kg ball is attached to the bottom end of a length of rope with a breaking strength of 44.5 N The top end of the rope is held stationary. The ball is released from rest with the line taut and horizontal $(\theta = 90.0^{\circ})$. At what angle (measured from the vertical) will the rope break? Answer: 40.8°

$$
m=2.00kg - F - F^{200} - F - F^{200} - F = m \text{ or } F = m \text
$$

10. (Center of Mass and Linear Momentum) A system containing three objects, which is initially at rest, accelerates by the application of a net force. Masses and time dependent position vectors of objects are given as;

Find;

$$
m_1 = 1 \text{ kg}, \ m_2 = 3 \text{ kg}, \ m_3 = 8 \text{ kg}
$$
\n
$$
\vec{r_1} = (t^2 - 4)\hat{i} + 2\hat{j}
$$
\n
$$
\vec{r_2} = (4 - t)\hat{i} + 2\hat{j}
$$
\n
$$
\vec{r_3} = 2\hat{i} + (t - 3)\hat{j}
$$
\nii Acceleration of the center of mass of the system, a_{com} ,

\niii Net force on the system, F_{net} .

 $\textbf{Answer: i) } \vec{r}_{com} = \left[(t^2 - 3t + 24)\hat{i} + (8t - 16)\hat{j}\right]/12 \textbf{ ii) } \vec{a}_{com} = \hat{i}/6 \ m/s^2$ iii) $\vec{F}_{net} = 2\hat{i}$ N

4) (b) i)
$$
\vec{r}_{com} = \frac{m_1 \vec{r}_1 + m_2 \vec{r}_2 + m_3 \vec{r}_3}{m_1 + m_2 + m_3}
$$

\n $\vec{r}_{com} = \frac{(1)[(t^2 - 4)\hat{i} + 2\hat{j}] + (3)[(4 - t)\hat{i} + 2\hat{j}] + (8)[2\hat{i} + (t - 3)\hat{j}]}{1 + 3 + 8}$
\n $\vec{r}_{com} = \frac{(t^2 - 3t + 24)\hat{i} + (8t - 16)\hat{j}}{12}$
\n $\vec{r}_{com} = \frac{d^2 \vec{r}_{com}}{dt^2} = \frac{2\hat{i}}{12} = \frac{\hat{i}}{6} m/s^2$
\n(ii) $\vec{F}_{net} = M.\vec{q}_{com} \Rightarrow \vec{F}_{net} = (t + 3 + 8).\frac{\hat{i}}{6} \Rightarrow \vec{F}_{net} = 2\hat{i} N$

11. (Center of Mass and Linear Momentum) The rigid body shown in figure given below consists of three particles connected by massless rods. It is to be rotated about an axis perpendicular to its plane through point P.

If $M = 0.40$ kg, $a = 30$ cm, and $b = 50$ cm, What is the rotational inertia about point P?

Answer: $I = 0.208$ kgm²

12. (Center of Mass and Linear Momentum) A 3.2 kg box slides on a horizontal frictionless table and collides with a 2.0 kg box initially at rest on the edge of the table, at height $h = 0.40$ m. The speed of the 3.2 kg box is 3.0 m/s just before the collision.

If the two boxes stick together because of packing tape on their sides, what is their kinetic energy just before they strike the floor?

Answer: $KE = 29 \text{ J}$
 $M_{1=}3.2 \text{ kg} \, \vartheta_{1}$
 $M_{2=}20 \text{ kg} \, \vartheta_{2} = 0$
 $\vartheta_{2=}20 \text{ kg} \, \vartheta_{2} = 0$
 $\vartheta_{1=}20 \text{ kg} \, \vartheta_{2}=0$
 $\vartheta_{2=}20 \text{ kg} \, \vartheta_{2}=0$
 $\vartheta_{1}=20 \text{ kg} \, \vartheta_{2}=0$
 $\vartheta_{2=}20 \text{ kg} \, \vartheta_{2}=0$
 $\vartheta_{1}=20 \text$ $K=?$ before impact to floor

13. (Center of Mass and Linear Momentum) The mass $m_1 = 1.0 \; kq$ moving with a speed $v_1 = 5.0$ m/s on a horizontal frictionless floor collides with a mass $m_2 = 2.0$ kg initially at rest. After the collision, m_1 moves at a speed $v_{1f} = 3.0$ m/s and m_2 moves at a speed v_{2f} along the directions shown in the figure.

iv Find the impulse delivered to m_1 during the collision. Give your answer in terms of unit vector notation.

Answer: i) $v_{2f} = 2.0 \, m/s$ ii) Inelastic iii) $\vec{v}_{com_f} = 5/3 \, m/s \, \hat{i}$ iv) $\vec{J}_1 = (-3.2\hat{i} + 2.4\hat{j}) \; kgm/s$

$$

\n
$$
\frac{v_2}{2} = 2.0 m/s
$$
\n
$$
\frac{v_3}{3} = 2.0 m/s
$$
\n<math display="block</math>
$$

5 c) Find the velocity of the center of mass of the system after collision. Give your answer in terms of unit vector notation.
 $\bigcup_{c \in n_{\ell_{\alpha}}} \bigcup_{c \in (0)} (3.0) \sin 33 - (2.0) \sin 33$

$$
\frac{10^{20}C_{cm}}{10^{20}C_{cm}} = \frac{10^{20}C
$$

 $\overline{5}$ d) Find the impulse delivered to m_1 during the collision. Give your answer in terms of unit vector

notation.
\n
$$
\overline{J_1} = \overline{P_1} - \overline{P_1}
$$

\n $P_1x = m_1U_{fx} = \frac{3}{4} = (1.0) (3.0) \cos 53 = 1.8 \text{ kg/m/s}$
\n $P_1x = m_1U_{fx} = (1.0)(3.0) \sin 33 = 2.4 \text{ kg/m/s}$
\n $P_1x = m_1U_{fix} = (1.0)(3.0) = 5.0 \text{ kg/m/s}$
\n $P_11x = m_1U_{fix} = (1.0)(9.0) = 5.0 \text{ kg/m/s}$
\n $P_11y = 0$

- 14. (Rotation) The angular position of a point on the rim of a rotating wheel is given by $\theta = 4.0t + 3.0t^2 + t^3$, where θ is in radians and t is in seconds. What are the angular velocities at
	- i $t = 2.0$ s and $t = 4.0$ s,
	- ii What is the average and instantaneous angular acceleration for that time interval?

Answer: i) $w(t = 2.0 \text{ s}) = 28 \text{ rad/s} \text{ w}(t = 4.0 \text{ s}) = 76 \text{ rad/s}$ ii) 24 rad/s^2

$$
6 = 4.0t + 3.0t^{2} + 31
$$

\n
$$
i) \quad \omega = \frac{d\theta}{dt} = 4.0 + 6.0t + 4.3t^{2} - 16 \quad \text{where } t = 2.0, \text{ and } t = 4.05 \text{ and } t = 2.0 \text{ and } t = 4.05 \text{ and } t = 4.05 \text{ and } t = 4.05 \text{ and } t = 2.4 \text{ and } t = 2
$$

15. (Rotation) In figure, two 6.2 kg blocks are connected by a massless string over a pulley of radius 2.40 cm and rotational inertia $7.40 \times$ 10^{-4} kg.m². The string does not slip on the pulley; it is not known whether there is friction between the table and the sliding block; the pulley axis is frictionless. When this system is released from rest, the pulley turns through 0.650 rad in 91.0 ms and the acceleration of the block is constant. What are

- i the magnitude of the pulley's angular acceleration,
- ii the magnitude of either block's acceleration,
- iii string tension T_1 ,
- iv string tension T_2 ?

Answer: i) 157.0 rad/s ii) 3.8 m/s^2 iii) $T_1 = 37.4 N$ iv) $T_2 = 32.6 N$

16. (Rotation - 40%) In figure, a wheel of radius 0.20 m is mounted on a frictionless horizontal axle. A massless cord is wrapped around the wheel and attached to a 2.0 kg box that slides on a frictionless surface inclined at angle $\theta = 20°$ with the horizontal. The box accelerates down the surface at 2.0 m/s^2 .

17. (Rotation - 40%) The reel shown in Figure has radius $R = 0.300$ m and moment of inertia $I = 1.00 \; kg.m^2$. One end of the block of mass $m =$ 0.500 kg is connected to a spring of force constant $k = 50.0 N/55$, and the other end is fastened to a cord wrapped around the reel. The reel axle and the plane having an inclination of $\theta = 37^\circ$ are frictionless. The reel is wound counterclockwise so that the spring stretches a distance $d = 0.200$ m from its unstretched position and is then released from rest.

Find the angular speed of the reel when the spring is again unstretched.

Answer: 1.74 rad/s

18. (Rotation - 40%) A $m_1 = 15.0$ kg object and a $m_2 = 10.0$ kg object are suspended, joined by a cord that passes over a pulley with a radius of $R = 10.0$ cm and a mass of $M = 3.00$ kg as seen in the Figure.

The cord has a negligible mass and does not slip on the pulley. The pulley rotates on its axis without friction. The objects start from rest $d = 3.00$ m apart. Treat the pulley as a uniform disk, and determine the speeds of the two objects as they pass each other.

Hint: $I_{CM} = \frac{1}{2}MR^2$

Answer: 2.36 m/s

19. (Rolling, Torque, and Angular Momentum) A hollow cylinder of outer radius $R = 5$ cm and mass $M = 50$ g with moment of inertia about the center of mass $I_{com} = MR^2$ starts from rest and moves down an incline tilted at an angle $\theta = 20^{\circ}$ from the horizontal. The center of mass of the cylinder has dropped a vertical distance $h = 30$ cm when it reaches the bottom of the incline. The coefficient of static friction between the cylinder and the surface is μ_s . The cylinder rolls without slipping down the incline. Answer: i) $\mu_s > 0.18$ ii) $v = 1.7$ m/s

- i What is the minimum value for the coefficient of static friction μ_s such that the cylinder rolls without slipping down the incline plane?
- ii What is the magnitude of the velocity of the center of mass of the cylinder when it reaches the bottom of the incline?

20. (Rolling, Torque, and Angular Momentum - 40%) In figure given below, a constant horizontal force \vec{F}_{app} of magnitude 12 N is applied to a uniform solid cylinder by fishing line wrapped around the cylinder. The mass of the cylinder is 10 kg , its radius is 0.10 m, and the cylinder rolls smoothly on the horizontal surface. (Hint: $I_{COM} = \frac{1}{2}MR^2$)

- i What is the magnitude of the acceleration of the center of mass of the cylinder?
- ii What is the magnitude of the angular acceleration of the cylinder about the center of mass?
- iii In unit-vector notation, what is the frictional force acting on the cylinder?

CW -> as proutive (as our choice!)

() $T_{p}=L_{cum}+MR^2 = \frac{1}{2}MR^2+ME = \frac{3}{2}MR^2$
 $T_{app} = 2R = C = T_{p}\propto$ -> $2R_{app} = (\frac{3}{2}MR^2)$
 $\propto = \frac{4}{3} \frac{G_{app}}{MR} = \frac{4}{3} \frac{(12N)}{(10 \text{ kg})(0.10 \text{ m})} = \frac{16 \text{ rad/s}^2}{2}$ $g(7I)$ $\overrightarrow{F_{app}} = I2N$
 $M = 10 kg$
 $R = 0.10 m$ rolls smoothly rulls smoothly
 $\alpha = \frac{4}{3} \frac{F_{app}}{MR}$

(ii) $\alpha = 16 \text{ rad/s}^2$

(iii) $f = ?$ Fapp $f = ma(0)$

Fapp $-f = ma(0)$

Fapp $-f = ma(0)$ $= 16 rad/s²$ $12N - 10kyT6m/s2 = -1$ \overrightarrow{a} contracts

21. (Rolling, Torque, and Angular Momentum - 40%) The radius of the roll of paper shown in Figure is 7.6 cm and its moment of inertia is $I = 3.3 \times 10^{-3} kg.m^2$. A force of 2.5 N is exerted on the end of the roll for 1.3 s, but the paper does not tear so it begins to unroll. A constant friction torque of 0.11 $m.N$ is exerted on the roll which gradually brings it to a stop.

Assuming that the paper's thickness is negligible, calculate

- i the length of paper that unrolls during the time that the force is applied $(1.3 s)$ and
- ii the length of paper that unrolls from the time the force ends to the time when the roll has stopped moving.

Answer: i) 1.56 m ii)1.13 m

22. (Rolling, Torque, and Angular Momentum - 40%) A 500 g bird is flying horizontally at 2.24 m/s , not paying much attention, when it suddenly flies into a stationary vertical bar, hitting it $d = 25.0$ cm below the top as seen in the Figure. The bar is uniform, $l = 0.750$ m long, has a mass of 1.50 kg , and is hinged at its base. The collision stuns the bird do that it just drops to the ground afterward (but soon recovers to fly happily away).

Answer: i) 2.00 rad/s ii) 6.58 rad/s

- i) Angular momentum is conserved in the collision between the bird and the bar: $Li = Lf$ $mv(L-d) = (\frac{1}{3}ML^2) w$ (for the oxis at hinge) $\omega = \frac{3m\mathfrak{D}}{ML^2} (L-d) = \frac{3(0.5 \text{ kg})(2.24 \text{ m/s})(0.75 \text{ cm} - 0.25 \text{ cm})}{(1.5 \text{ kg})(0.75 \text{ cm})^2}$ $\omega = 2.00 \text{ rad/s}$
- ii) Energy is conserved in the motion of the bar ofter the collision; $E_1 = E_2$ $\frac{1}{2} \Sigma w_1^2 + M_g \frac{L}{\lambda} = \frac{1}{\lambda} \Sigma w_2^2$, $\Sigma = \frac{1}{3} M L^2$ $\frac{1}{\mathcal{L}}\left(\frac{1}{3}\mathcal{M}^{2}\right)w_{1}^{2} + \mathcal{M}g\mathcal{L} = \frac{1}{\mathcal{L}}\left(\frac{1}{3}\mathcal{M}^{2}\right)w_{2}^{2}$ $\omega_2 = \sqrt{\omega_1^2 + \frac{39}{L}} = \sqrt{(2.00) \text{ rad/s}^2 + \frac{3(9.80 \text{ m/s}^2)}{(0.750 \text{ m})}} = 6.58 \text{ rad/s}.$

1. A) A force $\vec{F} = (cx - 3x^2)\hat{x}$ acts on a particle as the particle moves along an x axis, with \vec{F} in newtons, x in meters, and c a constant. At $x = 0$, the particle's kinetic energy is 20.0 J; at $x = 3.00$ m, it is 11.0 J. Find c .

$$
w = \int \vec{F} \cdot d\vec{u} = \int \vec{F_x} \, d\vec{u} = \int (c\,\vec{x} - 3\vec{x}^2) \, d\vec{x}
$$

\n
$$
= \frac{c}{2} \vec{x}^2 - \vec{x}^3 \Big|_0^3 = 4.5c - 27 \, (3)
$$

\n
$$
w = \Delta K = K_f - K_i = 11 - 20 = -95 \, (6)
$$

\n
$$
\Rightarrow 4.5c - 27 = -9 \implies c = 4 \, \frac{\Delta V_m}{V_m}
$$

- B) You drop a 2.00 kg physics book to a friend who stands on the ground at distance $D=10.0$ m below. If your friend's outstretched hands are at distance $d=1.50$ m above the ground (see Figure),
- i How much work Wg does the gravitational force do on the book as it drops to her hands?
- ii What is the change ΔU in the gravitational potential energy of the book– Earth system during the drop?

If the gravitational potential energy U of that system is taken to be zero at ground level,

- iii what is U when the book is released?
- iv what is U when it reaches her hands?
- v Now take U to be 100 J at ground level and again find Wg , ΔU , U at the release point, and U at her hands.

i)
$$
w_g = F_g \cdot d = mgdcos \theta \{d = 10m - 1.5m = 8.5m
$$

\n $= (2lg)(1.3m/s) 8.5m (0.50^{\circ})$
\n $= 167.5$
\nii) $\Delta u = u_f - U_i = mg(y_f - y_f) = (2kg)(1.3m/s)(1.5m - 10m)$
\n $= -167.5$
\niii) $u_i = mg y_i = (2kg)(1.3m/s)(10m = 196.5 \text{ eV}) 2.95$
\niv) $w_g = \underline{167.5} \quad \Delta u = -167.5 \quad U_i = mgy_i + 100.5$
\n $= \frac{2.96.5}{129.5}$

- 2. A rod of length 30.0 cm has linear density (mass per length) given by $\lambda = 50.0 \frac{g}{m} + 20.0 x \frac{g}{m}$ where x is the distance from one end, measured in meters.
	- i What is the mass of the rod?
	- ii How far from the $x = 0$ end is its center of mass?

 0.3 2^{1} 9 $\lambda d= (50+20x/d)$ $15.$ $=$ xdm \mathbf{b} $dx =$ XCM \equiv $420x^{2}$ dx $\ddot{}$ $= 0.15$

3. A soccer player kicks a soccer ball of mass 0.40 kg that is initially at rest. The foot of the player is in contact with the ball for 2.0×10^{-3} s, and the force of the kick is given by

$$
F(t) = [(12.0 \times 10^9)t^2 - (4.0 \times 10^{12})t^3] N
$$

for $0 \le t \le 2.0 \times 10^{-3}$ s, where t is in seconds. Find the magnitudes of

- i the impulse on the ball due to the kick,
- ii the average force on the ball from the player's foot during the period of contact,
- iii the maximum force on the ball from the player's foot during the period of contact,
- iv the ball's velocity immediately after it loses contact with the player's foot.

 $m = 0.40 kg$

Fuitally at rest

Contact $\frac{E}{L}$ (12x10³) = 4x10⁹ + 3 + 1x10² + 12x10³

2.0x10³ = 5 = 4x10⁹ + 3 + 1x10¹² + 1

= (4x10⁹) = 1x10² + 1x10¹²) (16x10¹²) = 16Ns \hat{u}) $F_{av} = \frac{J}{\Delta t} = \frac{16Ns}{2.0 \times 0^3 s} = 8 \times 10^3 N$ iii) $f_{max} = ?$ during the pend of contact $\frac{dF(t)}{dt} = 0$
 $\Rightarrow 24 \times 10^2 t - 12 \times 10^2 t^2 = 0 \Rightarrow t = 2 \times 0^2 s$
 $\Rightarrow F(t=2 \times 0^3 s) = f_{max} = (12 \times 10^9)(2 \times 10^3 s)^2 - (4 \times 10^2)(2 \times 10^3 s)^3 = 16 \times 10^3 N$ (iv) v_2 ? when contact is lost
 $\Delta p^2 = P_f - P_t^2 = mV_f^2 - mV_c^2 \approx \Delta p = m\theta = \Delta \Rightarrow v = \frac{J}{m} = \frac{16Ns}{0.40kg} = \frac{40ms}{m}$

- 4. The angular position of a point on a rotating wheel is given by $\theta(t) =$ $2.0 + 4.0t^2 + 2.0t^3$, where θ is in radians and t is in seconds. At $t = 0$,
	- i what is the point's angular position?
	- ii what is its angular velocity?
	- iii what is its angular velocity at $t = 4.0$ s?
	- iv Calculate its angular acceleration at $t = 2.0$ s.
	- v Is its angular acceleration constant?

 $a+1=0$, $\theta_0=2.0$ rad. (2) b) $w = \frac{d^0}{dt^2} = 8 \text{ if } 6t^2 \text{ (4)}$
at $t = 0$ fo obtain $\omega_0 = 0$ For $t=4.5$, $\omega_{4}=(8)(4)+(6)(4)^{2}=128 rad$ $4: d\underline{u} = 8 + 12t$ (3) $d_2 = 8+(n)(2)=32 \text{ rad/s}^2$ of $x_1 = 6$

e) Angular acceleration depends on time;

it is not constant. (2)

- 5. A uniform ball, of mass $M = 6.0$ kg and radius R, rolls smoothly from rest down a ramp at angle $\theta = 30.0^{\circ}$ (see Figure, $I = \frac{2}{5}MR^2$)
- i The ball descends a vertical height $h =$ 1.20 m to reach the bottom of the ramp. What is its speed at the bottom?
- ii What are the magnitude and direction of the frictional force (f_s) on the ball as it rolls down the ramp?
